## **DETAILED ACTION**

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-10,12-15,17 and 18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nemoto et al. (JP 63-16816) in view of Mukai (JP 60-3922). Nemoto discloses a forming device (14,15,33) having a rotating frame (14,15) and a forming blade (33) movable in axial (y) and radial (x) directions. A tubular blank material (P) is held by clamps (15a,15b,15c,14a,14b,14c) and the forming blade (33) presses a side of a peripheral wall of the blank in order to form a tubular formed body. The forming blade cross section is an arc. The position and angle of the forming blade is controlled by a servo mechanism. Nemoto does not disclose that one of the clamps is movable axially. Mukai teaches movable hydraulic clamping means (8) which move axially when a forming blade (6) presses material against mandrels (2,3). The clamping means are biased by piston/cylinder (9,10). The mandrels have a wavy die shape that corresponds to a wall structure (7) of the finished material. The forming blade is reciprocated along the mandrel die structure to form a tubular body. It would have been obvious to one skilled in the art at the time of invention to provide Nemoto with at least one movable clamp means as taught by Mukai in order to control a wall thickness of the finished product.

Application/Control Number: 10/561,609

Art Unit: 3725

Regarding claims 2 and 4, the end part of the material that is clamped by the clamping means remains unworked by the forming blade and necessarily defines either and inner or outer diameter of the tubular body depending upon whether the forming blade contacts an inner or outer wall of the body.

Regarding claim 12, it is inherent that steel tubular bodies are processed by the forming means of Nemoto and Mukai, known steels have a breaking stress greater than 600MPa.

Claim 11 is rejected under 35 U.S.C. 103(a) as being unpatentable over Nemoto in view of Mukai and further in view of Hermanson (7,124,609). Nemoto in view of Mukai does not disclose further processing by inner and outer rollers. Hermanson teaches rolling blades (32) for forming an outer wall (fig. 3) or an inner wall (fig. 5) portion of a tubular body (10). Further processing is accomplished by roller pairs (202,210) or (222,232). It would have been obvious to one skilled in the art at the time of invention to process the tubular body of Nemoto in view of Mukai with finishing roller pairs as taught by Hermanson in order to form mating surfaces or connection points.

Claim 16 is rejected under 35 U.S.C. 103(a) as being unpatentable over Nemoto in view of Mukai and further in view of Wickwire et al. (2,826,804). Nemoto in view of Mukai does not disclose that the clamp moving means is a spring. Wickwire teaches a spring (37) for biasing an edge (25) of a workpiece. It would have been obvious to one skilled in the art at the time of invention to substitute the spring of Wickwire for the hydraulic clamp moving means of Nemoto in view of Mukai in order to move the clamping means without a pressure source.

Art Unit:.3725

## Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
